

COMMERCIAL PROFILE

One tool. The whole estate. Every layer.

No dedicated patch platform yet? The Commercial profile patches the OS, Office, browsers and every third-party app in one pass — with the fleet-safe behaviours a shared network needs.

THE PROBLEM

Without a platform, patching doesn't scale

Every device becomes someone's manual chore.

No Intune, no SCCM, no RMM — just a fleet of Windows machines, each drifting out of date at its own pace, with no consistent record of what's actually patched.

NO CONSISTENCY

Each machine patched on its own schedule, or none.

NO VISIBILITY

No record of what's patched fleet-wide, or what's overdue.

NO SAFETY NET

A whole fleet hitting the network, or rebooting, at once.

THE PROFILE

One script owns every layer

Commercial profile patches the OS, Office, browsers and third-party apps — the full stack — deployed identically to every machine, with a report proving the result.

Patch

Every provider, on by default — nothing left for a platform you don't have.

Verify

Confirms each result by re-reading the installed version, machine by machine.

Prove it

One report per device, rolling up into a single fleet-wide view.

No agent. No service. No licence — a single `.ps1` file plus a JSON config, deployed however you already reach the fleet.

EVERYTHING, ONE PASS

Coverage

● Windows Update OS quality & security	● WinGet All upgradable packages	● Microsoft Store Store & MDM bridge	● Microsoft 365 Click-to-Run
● Chrome / Edge Native updaters	● Chocolatey / Scoop Package managers	● Runtimes .NET, Python, Node.js	● Vendor updaters Extensible catalogue
● OEM firmware Opt-in (Dell/HP/Lenovo)	● End-of-life Report-only · endoflife.date	● Patched by default ● Opt-in ● Report-only	

BUILT FOR THE FLEET

Fleet-safe by design

One machine can patch freely. A fleet sharing a network and a helpdesk needs more care — Commercial profile adds it automatically.

Bandwidth throttling

BITS transfers are capped so patch downloads don't crowd out everyday traffic — reverted automatically when the run ends.

Jittered scheduling

A hostname-seeded delay spreads the fleet across the maintenance window, instead of one thundering herd.

Deployment rings

Registry-driven Pilot / Early / Broad rings via GPO, so changes stagger rather than land on every device at once.

Same protections as a managed platform — without needing one.

PROOF

One dashboard, the whole estate

Every device writes the same evidence — patched, verified, timestamped — and every report rolls up into one fleet view.

- HTML Interactive per-device report — search, filter, print.
- JSON Machine-readable results for automation.
- CSV Flat export for SIEM, Excel or Power BI.

Point reports at a central share and the fleet dashboard builds itself — stale hosts, KEV exposure and SLA breaches, estate-wide.

OPERATIONAL SAFETY

Safe by default

Dry-run first

Preview every change before anything runs.

Pre-flight checks

Disk, battery, pending reboot, connectivity.

System restore point

Created before patching begins on every device.

Maintenance windows

Patch out of hours; defer while a device is in use.

THE LINE WE DON'T CROSS

It never reboots a machine.

Reboot-required is flagged in the report and exit code **3010** — the restart decision stays with the estate owner.

THE RECOMMENDATION

Full coverage, fleet-safe rollout, zero licence cost.

Every layer, owned

OS to third-party apps — no gap left for a platform we don't have.

Safe at scale

Throttling, jitter and rings — built for a shared fleet, not just one PC.

Costs nothing

MIT-licensed, no agent, no service — deploy with what we already have.

PATCH. VERIFY. PROVE IT.
