

PERSONAL PROFILE

Your PC, patched. Automatically.

Four commands, and your machine keeps every app current from then on — Windows, Office, browsers and third-party tools — with a fresh report after every run.

WHY BOTHER

Windows Update isn't the whole story

The apps you live in are the ones that quietly fall behind.

Your browser, your runtimes, your utilities — each with its own updater, or none at all. Keeping them current by hand is the chore nobody keeps up.

BROWSERS

Chrome, Edge, Brave — patched the moment a fix ships.

RUNTIMES & TOOLS

Python, Node, Chocolatey and Scoop apps kept fresh.

OFFICE & STORE APPS

Microsoft 365 and Store apps, all in one pass.

THE TOOL

One file does all of it

PatchManager is a single PowerShell script. It finds what's out of date, updates it, and proves the result — all locally, with nothing to sign up for.

Patch

Every app, every source, in a single pass — no chasing separate updaters.

Verify

Confirms each update actually took by re-reading the installed version.

Prove it

Writes a tidy HTML report you can open any time to see what changed.

Runs entirely on your PC — no account, no cloud, no subscription.

SETUP

Four commands, then it's yours

1

Get the code

```
git clone ... C:\ProgramData\PatchManager
```

2

Preview — changes nothing

```
.\Invoke-PatchManager.ps1 -DryRun -Force
```

3

Patch for real

```
.\Invoke-PatchManager.ps1 -Force
```

4

Set and forget

```
.\Invoke-PatchManager.ps1 -InstallStartupTask
```

Run in an elevated PowerShell. Step 4 is the whole point — after it, patching just happens.

AFTER SETUP

It runs itself from now on

Runs after every startup & logon

A couple of minutes in, silently in the background — no console window in your way.

A fresh report every time

Reports land in your Reports folder; the popup offers to open the latest.

Stays out of your way

Optionally defers while you're actively using the machine, retrying next trigger.

Never trips over itself

A single-instance lock means dense startup triggers are always safe.

No configuration needed — the Personal defaults already suit a single machine.

EVERYTHING ON

What it keeps current

- **Windows Update**
OS quality & security

- **WinGet & Store**
Your installed apps

- **Microsoft 365**
Click-to-Run

- **Chrome / Edge**
Native updaters

- **Chocolatey**
On by default (free CLI)

- **Scoop & Python**
Per-user managers

- **End-of-life**
Report-only heads-up

- Patched automatically
- Report-only, never changes

Self-update is on too, so the tool keeps itself current from published releases.

PEACE OF MIND

Safe on your own machine

Preview first

Dry-run shows exactly what would change.

Restore point

Created before any patching begins.

Battery-aware

Pre-flight checks skip risky moments.

One readable file

Read it yourself before you run it.

THE GOLDEN RULE

It never reboots your PC.

If a restart is needed to finish, it just tells you — the decision, and the timing, stay yours.

GET STARTED

Set it once. Forget it for good.

Always current

Every app patched after each startup — Windows and third-party alike.

Provable

A fresh report after every run — one click to see what changed.

Free

MIT-licensed and local — no account, no cloud, no subscription.

PATCH. VERIFY. PROVE IT.
